

Beacon

This pedal is a vintage sound silicon-fuzz with NOS (new old stock) -transistors. Powerful but flexible circuit produces sounds from pushed crunch tones to all out wild fuzz. More than enough volume on tap if you want to push your amp to heavy distortion and beyond.

By rolling down your guitar's volume you get additional control. Doesn't clean up as you might expect but offers a good crunch tone. Beacon doesn't really like treble bleeds or buffers so be careful when placing it in your signal chain.

Volume controls the output of the circuit.

Fuzz controls the signal going into the circuit.

True bypass

9V from an external power supply (no battery option)

Handmade in Jyväskylä, Finland
